DISTRIBUTION FUNCTIONS OF DARK MATTER HALOS

Axel Gross, University of Minnesota

In Collaboration with Yong-Zhong Qian and Zhaozhou Li

The NFW Profile

- In 1997, Navarro, Frenk, and White showed that dark matter halos can be universally fit by a single functional form:

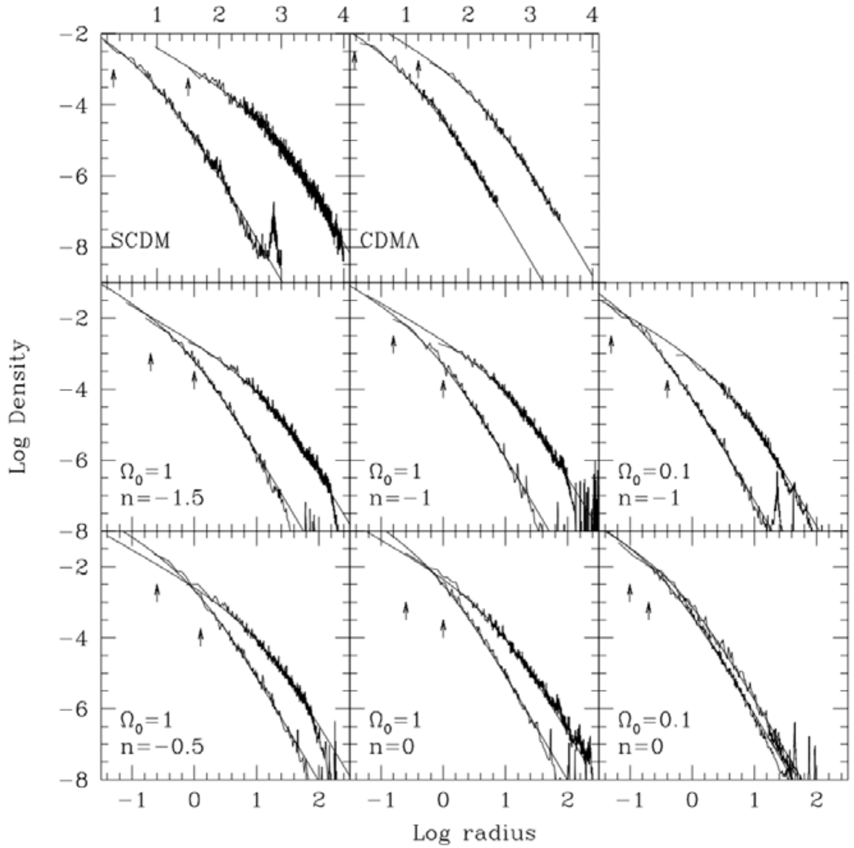

Image Credit: Navarro, Frenk, White, 1997

The NFW Profile (2)

- In 1997, Navarro, Frenk, and White showed that dark matter halos can be universally fit by a single functional form: $\rho(r) = \dfrac{\rho_0}{\frac{r}{R_S}\left(1+\frac{r}{R_S}\right)^2}$
- Because this is divergent, it is common to define an edge of the halo so the average density is $200\rho_c$, and the concentration as the ratio of the virial and scale radius

$$R_{vir} = \left(\frac{3M}{4\pi\,(200\rho_c)}\right)^{1/3} \qquad R_{vir} = cR_s$$

$$M = 4\pi\rho_0 R_s^3\left[\ln\left(1+\frac{R_{vir}}{R_s}\right) - \frac{R_{vir}}{R_{vir}+R_s}\right] \qquad (M, c) \Leftrightarrow (R_s, \rho_0)$$

The NFW Profile (3)

- Simulations show a loose relationship between halo mass and concentration:

The Distribution Function

- We define the distribution function:

$$\int d^3x d^3v f(\vec{x}, \vec{v}, t) = 1 \qquad dP = d^3x d^3v f(\vec{x}, \vec{v}, t)$$

- Conservation of probability gives the collisionless Boltzmann Equation:

$$\frac{\partial f}{\partial t} + \mathbf{v} \cdot \frac{\partial f}{\partial \boldsymbol{x}} - \frac{\partial \phi}{\partial \boldsymbol{x}} \cdot \frac{\partial f}{\partial \boldsymbol{v}} = 0$$

- Define an integral of motion (IOM) to be:

$$\frac{d}{dt} I[x(t), v(t)] = 0$$

$$\frac{\partial I}{\partial \boldsymbol{x}} \cdot \frac{\partial \boldsymbol{x}}{\partial t} + \frac{\partial I}{\partial \boldsymbol{v}} \cdot \frac{\partial \boldsymbol{v}}{\partial t} = 0 \qquad \Rightarrow \qquad \boldsymbol{v} \cdot \frac{\partial I}{\partial \boldsymbol{x}} - \frac{\partial \phi}{\partial \boldsymbol{x}} \cdot \frac{\partial I}{\partial \boldsymbol{v}} = 0$$

The Distribution Function (2)

- Jeans Theorem: Any steady-state solutions must depend on the phase space coordinates through only IOM, and any function of IOM must be a steady state solution:

$$\frac{d}{dt}f(I_1, \ldots, I_n) = \sum_{m=1}^{n} \frac{\partial f}{\partial I_m}\frac{dI_m}{dt} = 0$$

- In spherical symmetry, integrals of motion are E and $\vec{\mathrm{L}}$.
- A distribution function that only depends on E is called ergodic

$$f(E) = f(\frac{v^2}{2} + \phi(r))$$

The Distribution Function (3)

- If you have the distribution function, it is straightforward to determine the density:

$$\rho(r) = M\int d^3v\, f\left(\frac{1}{2}v^2 + \phi(r)\right) = 4\pi M\int dE\, f(E)\sqrt{2(E-\phi(r))}$$

- We can also relate the distribution function to the number density:

$$g(E) = \int d^3r d^3v\, \delta\left(\frac{1}{2}v^2 + \phi(r) - E\right) = 16\pi^2\int dr\, r^2\sqrt{2(E-\phi(r))}$$

$$N(E) = g(E)f(E)$$

- Thus, we can relate N(E) and ρ(r)

$$\rho(r) = 4\pi M\int dE\, \frac{N(E)}{g(E)}\sqrt{2(E-\phi(r))}$$

- Density must also determine the potential

$$\nabla^2\phi = 4\pi G\rho$$

A Self Consistent Energy Distribution

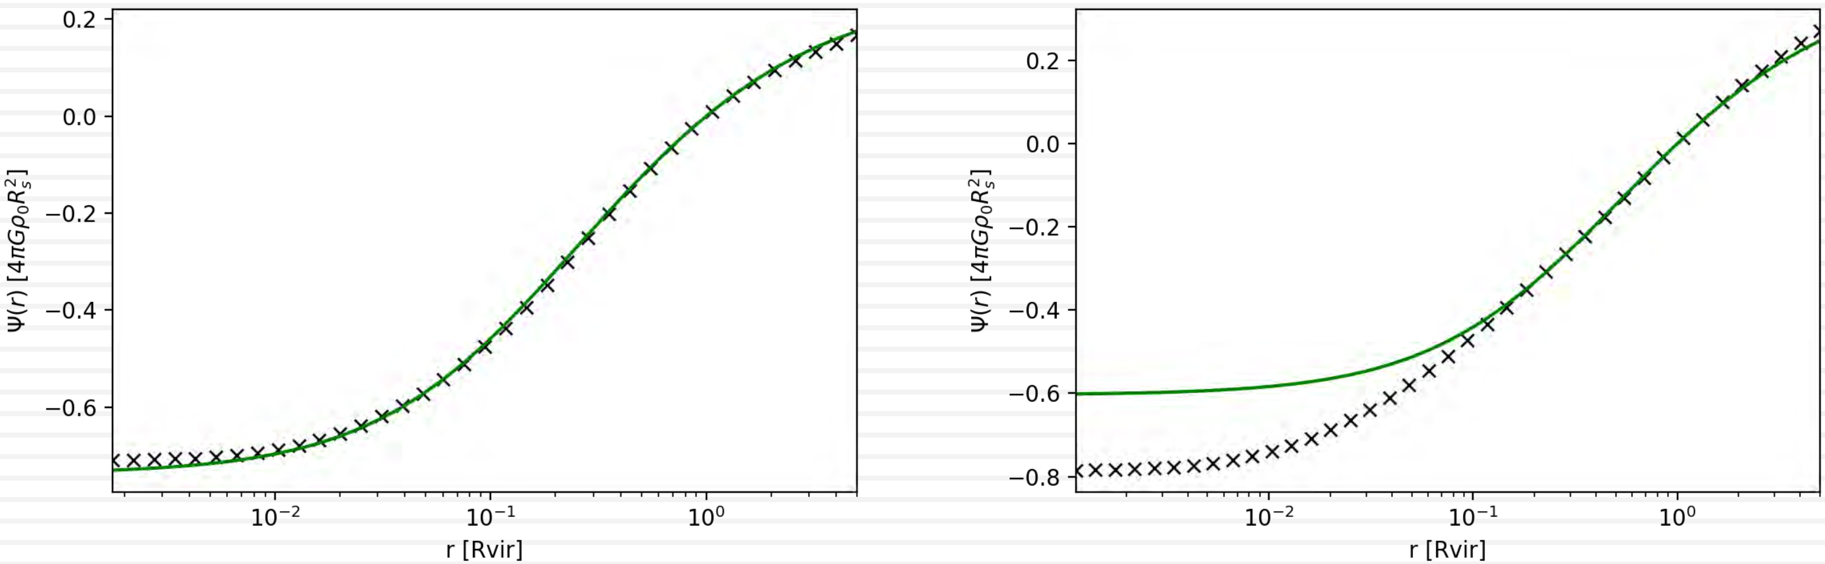
- The distribution function can be calculated through an Eddington inversion:

$$f(E) = \frac{1}{\sqrt{8}\pi^2 M} \frac{d}{dE} \int \frac{d\phi}{\sqrt{\phi - E}} \frac{d\rho}{d\phi}$$

- After inversion of the NFW profile, the density of states can be used to find N(E), and this can be compared to that of numerical simulations.
- We calculate N(E) inside the virial radius, and compare to N(E) obtained from N-body simulation

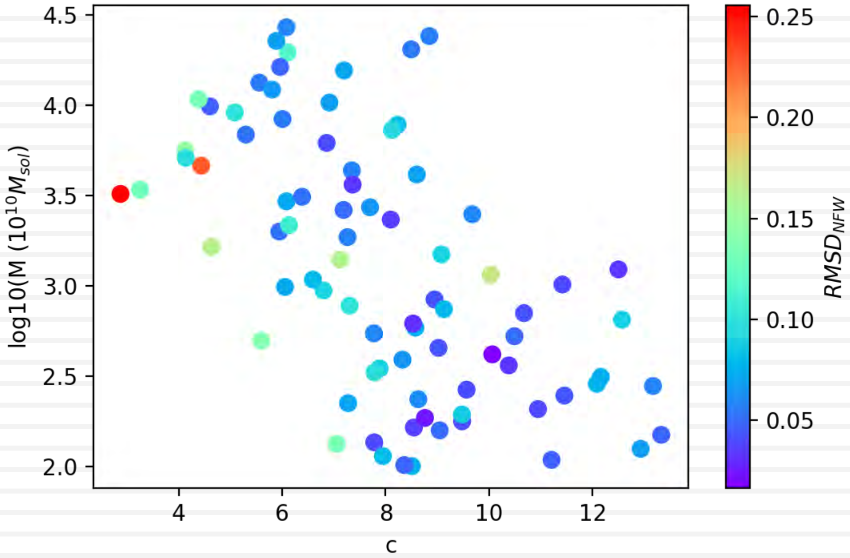
Important Factors to Consider

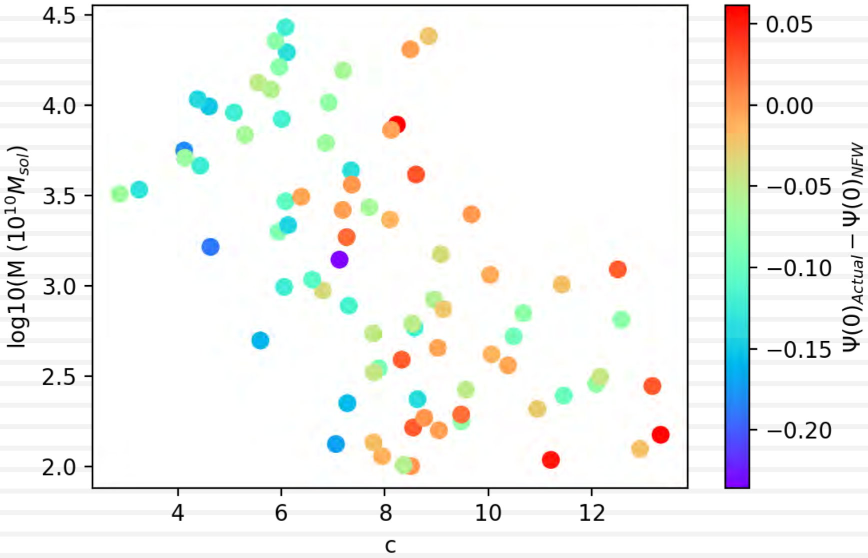
- Central Potential Deviation: define $\psi(R_{vir}) = 0$



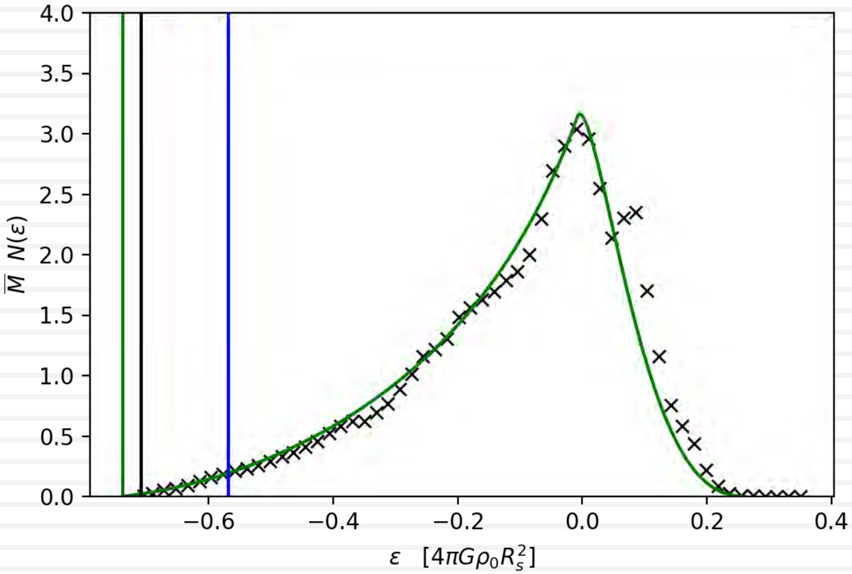
- N(E) normalization: the best fit NFW to a simulated halo has a different total mass

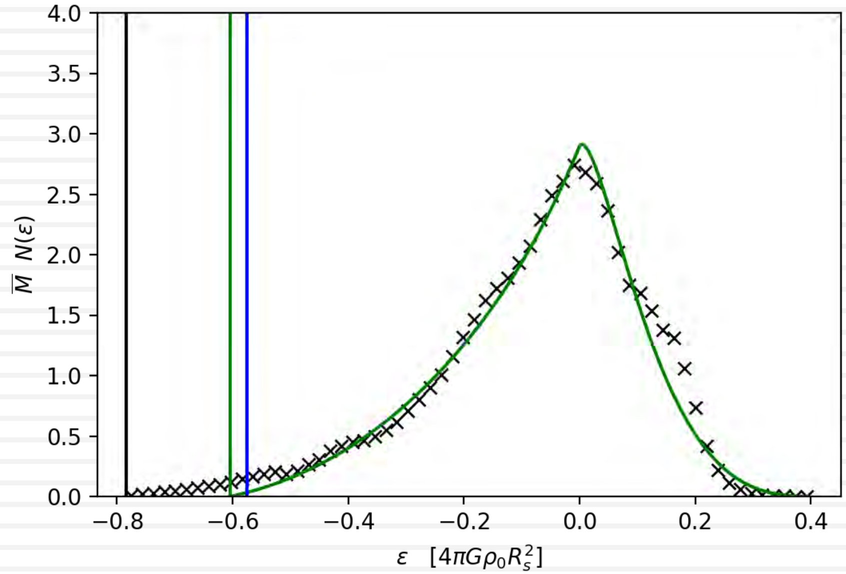
N-Body Simulations



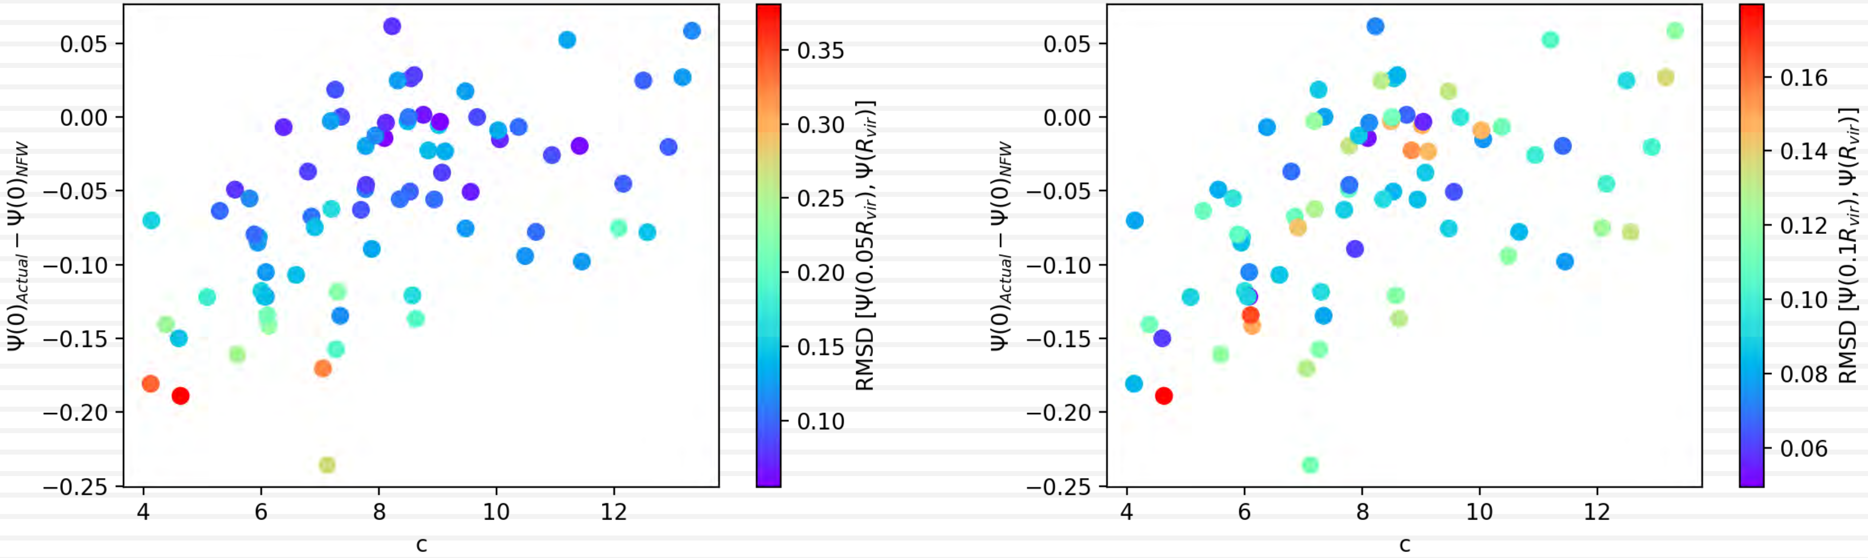


Comparison of N(E)





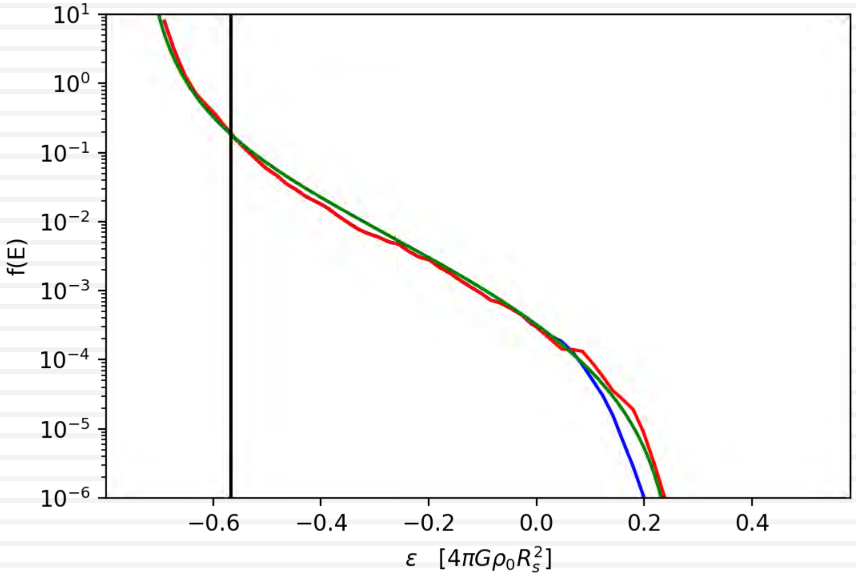
Comparison of N(E) (2)

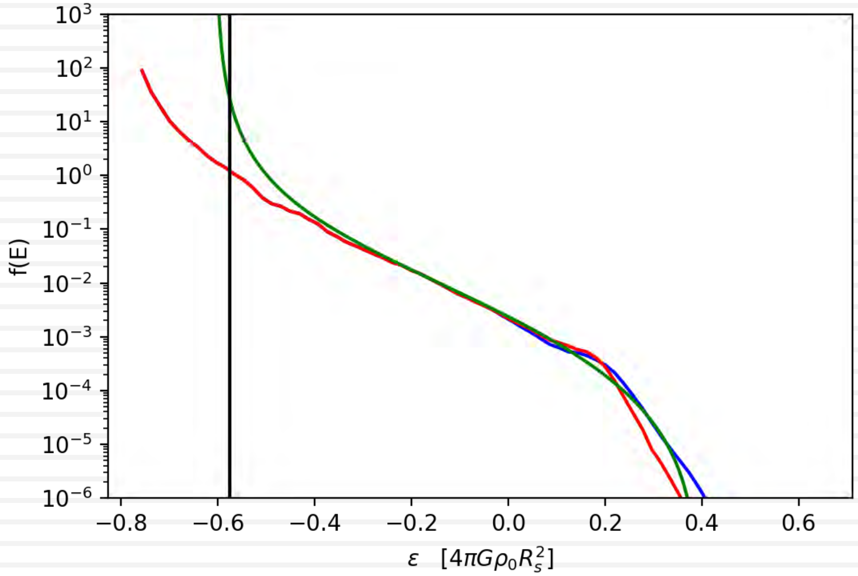


Comparison of f(E)

- If the halo is fully equilibrated, f(E) should be uniform for the entire system
- We can calculate f(E) for simulated halos by using the numerical potential to calculate g(E).
- Doing this with two different sample regions (inside R_{vir} and inside 2.5 R_{vir}) allows us to test the equilibration of the halo.
- Additionally, we can compare this to the f(E) obtained from the NFW profile
- Proper metric of comparison is $\overline{\mathrm{M}}$ f(E)

Comparison of f(E) (2)





Conclusions

- The NFW profile provides a good approximation to the density profiles of dark matter halos
- With proper considerations, we can generate an energy distribution from the NFW profile which agrees above $E > \psi(0.05R_{vir})$ with that of simulated halos
- We also find good agreement of the distribution function of the NFW profile with that of simulated halos, and that the halos are well equilibrated.
