Pulsar Triple System PSR J0337+1715

Pulsar Triple System PSR J0337+1715

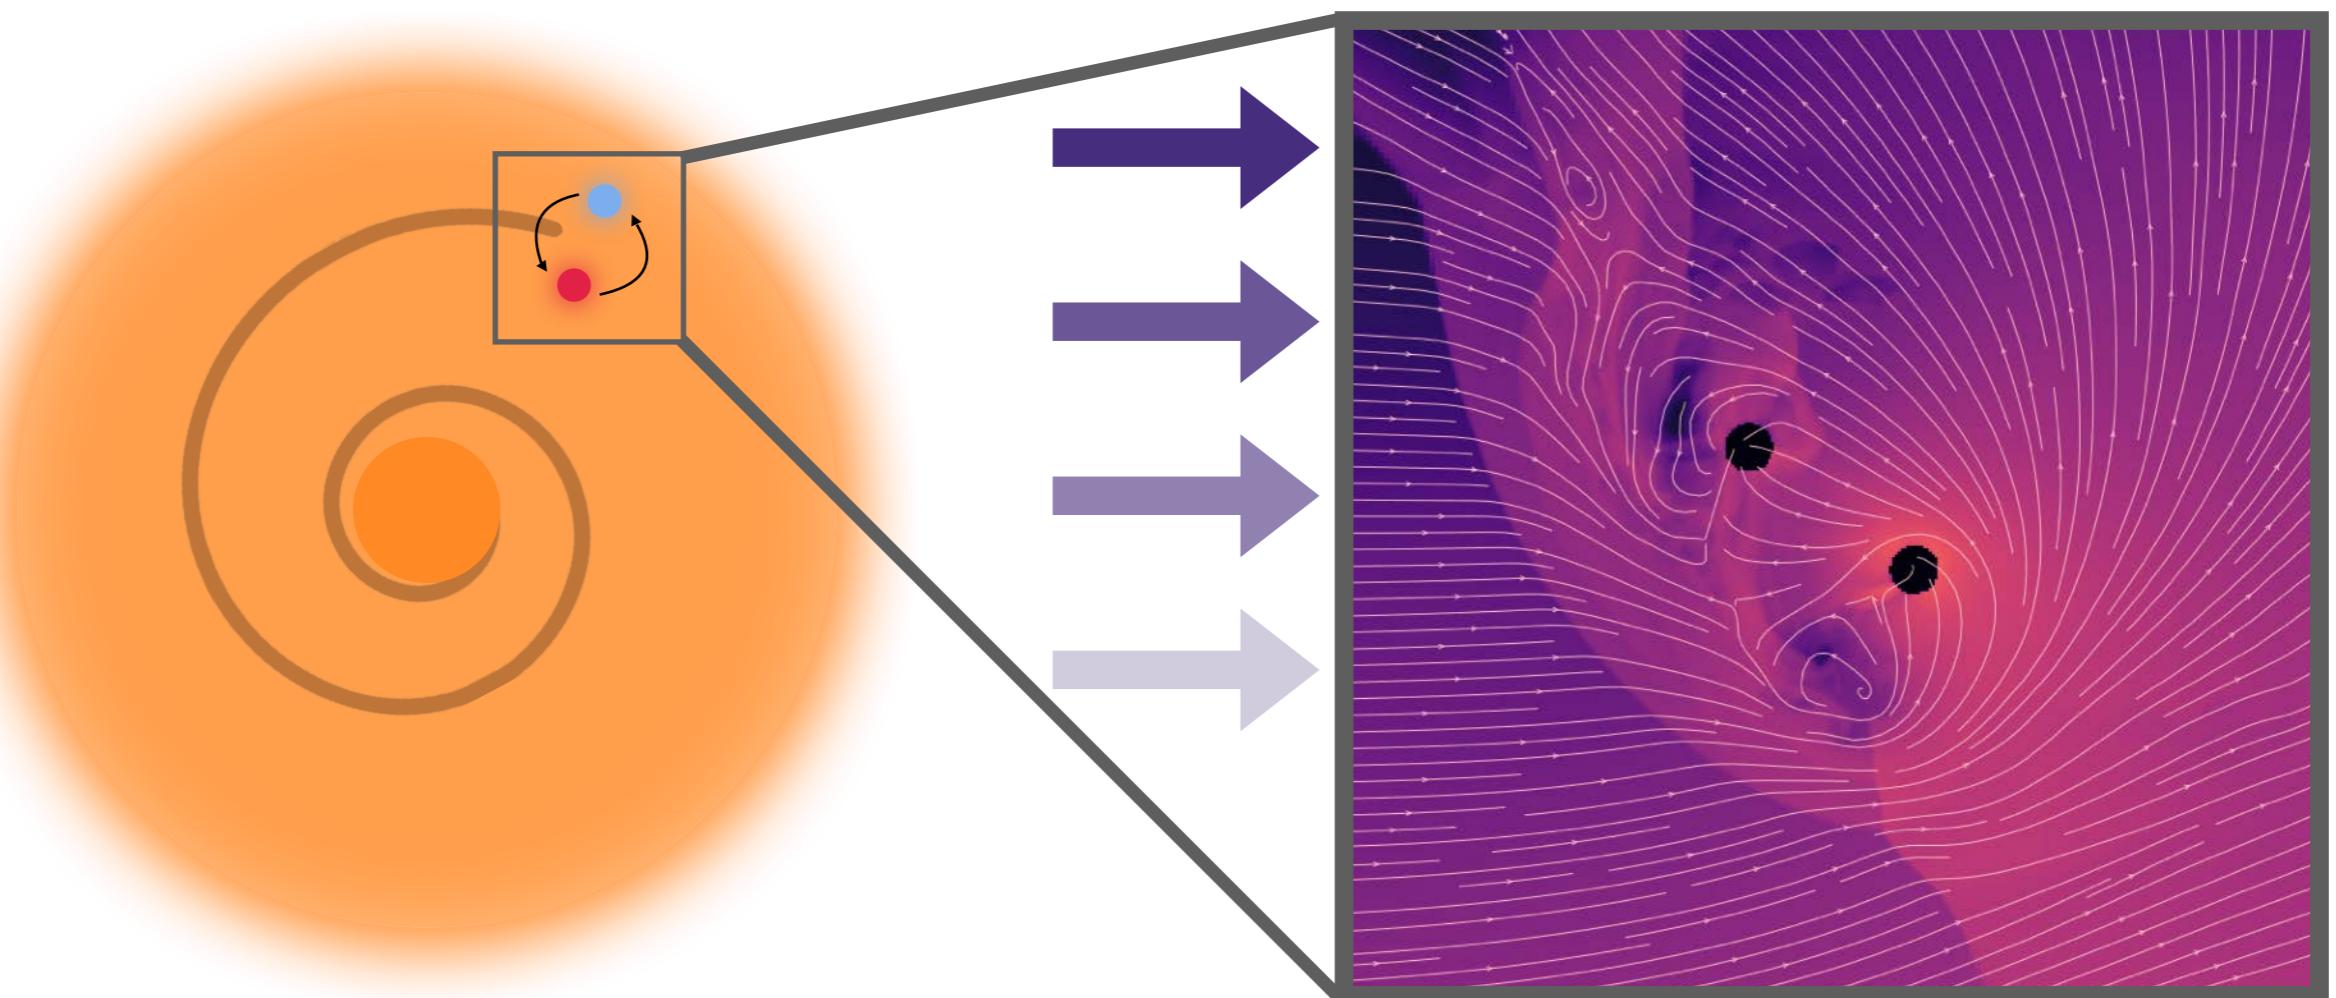

Common Envelope Evolution

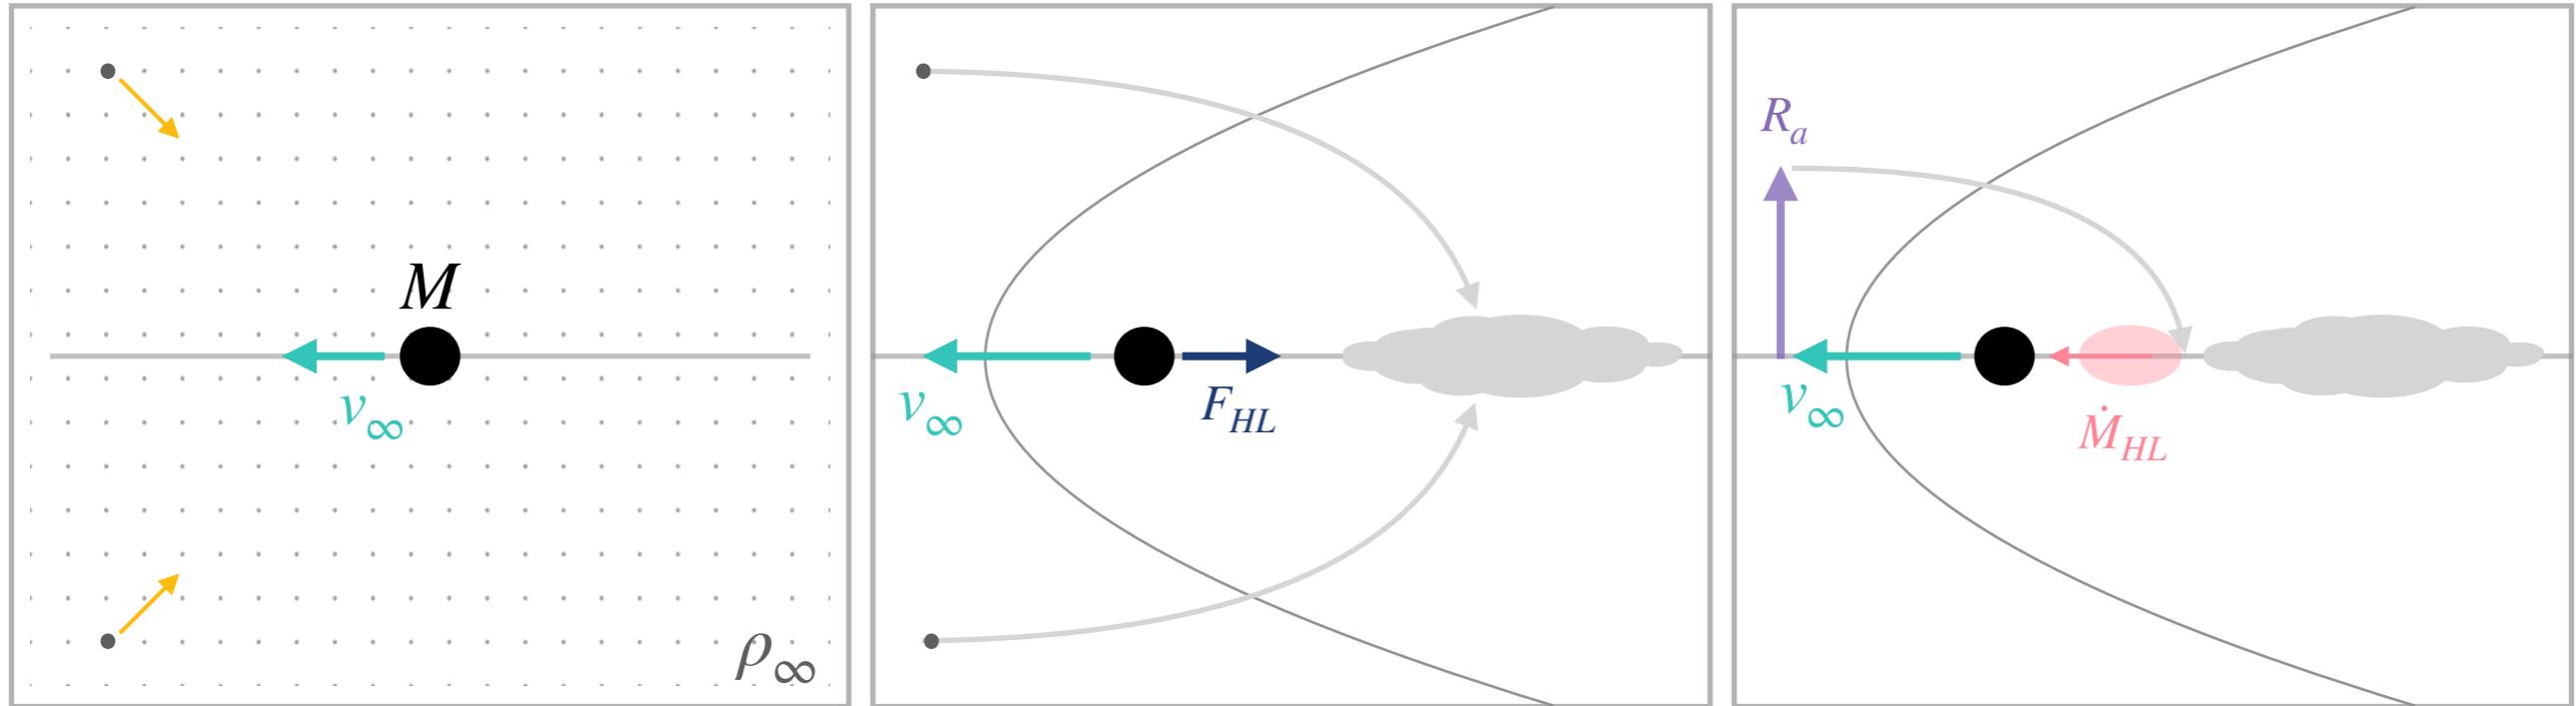

Final configuration of the system

Common Envelope Evolution

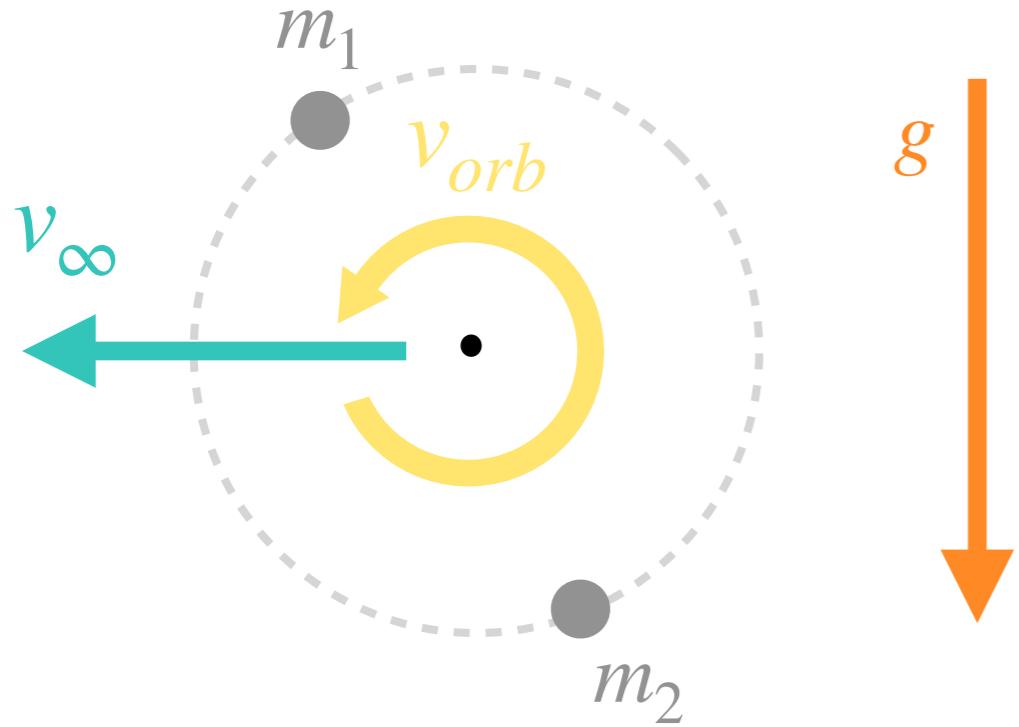

Hoyle Lyttleton Accretion (HLA)

$$R_a = \frac{2GM}{v_\infty^2}$$

$$\dot{M}_{HL} = \pi R_a^2 \rho_\infty v_\infty$$
$$F_{HL} = \dot{M}_{HL} v_\infty$$

Binary Hoyle Lyttleton Accretion

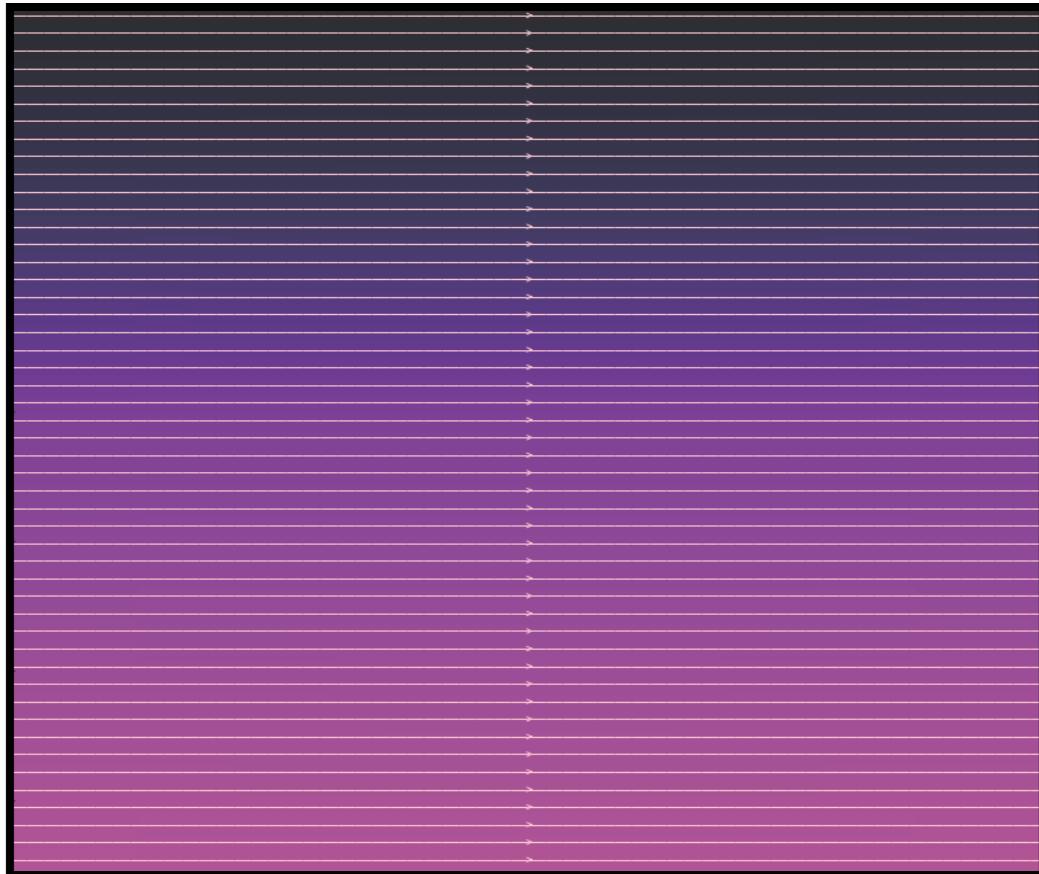

Semi-major axis, a_0

$$m = m_1 + m_2$$

$$R_a = \frac{2Gm}{v_\infty^2}$$
$$v_k = \left(\frac{GM}{r} \right)^{1/2} = v_\infty$$

Adding a density gradient

$$H_\rho = -\rho \frac{dr}{d\rho}$$

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

For no density gradient:

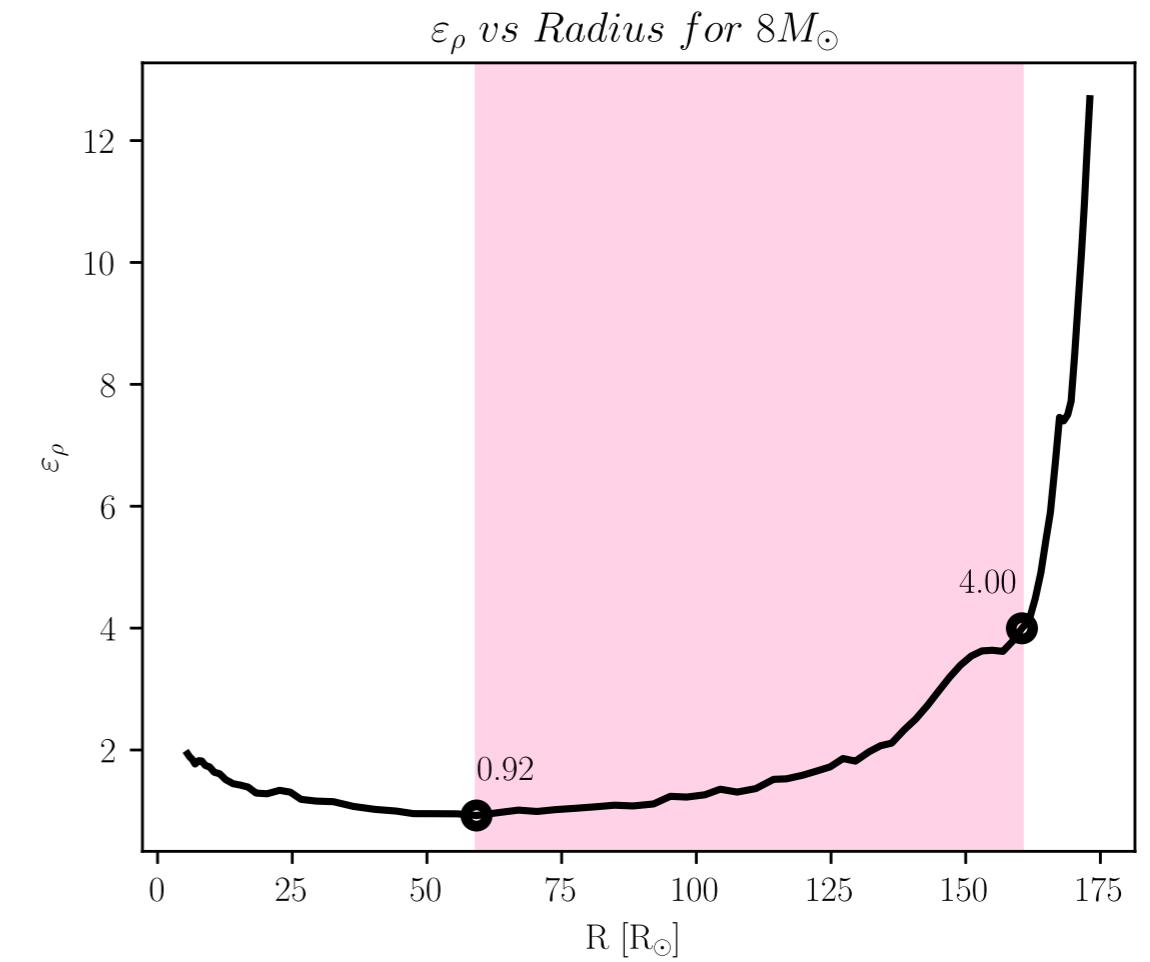

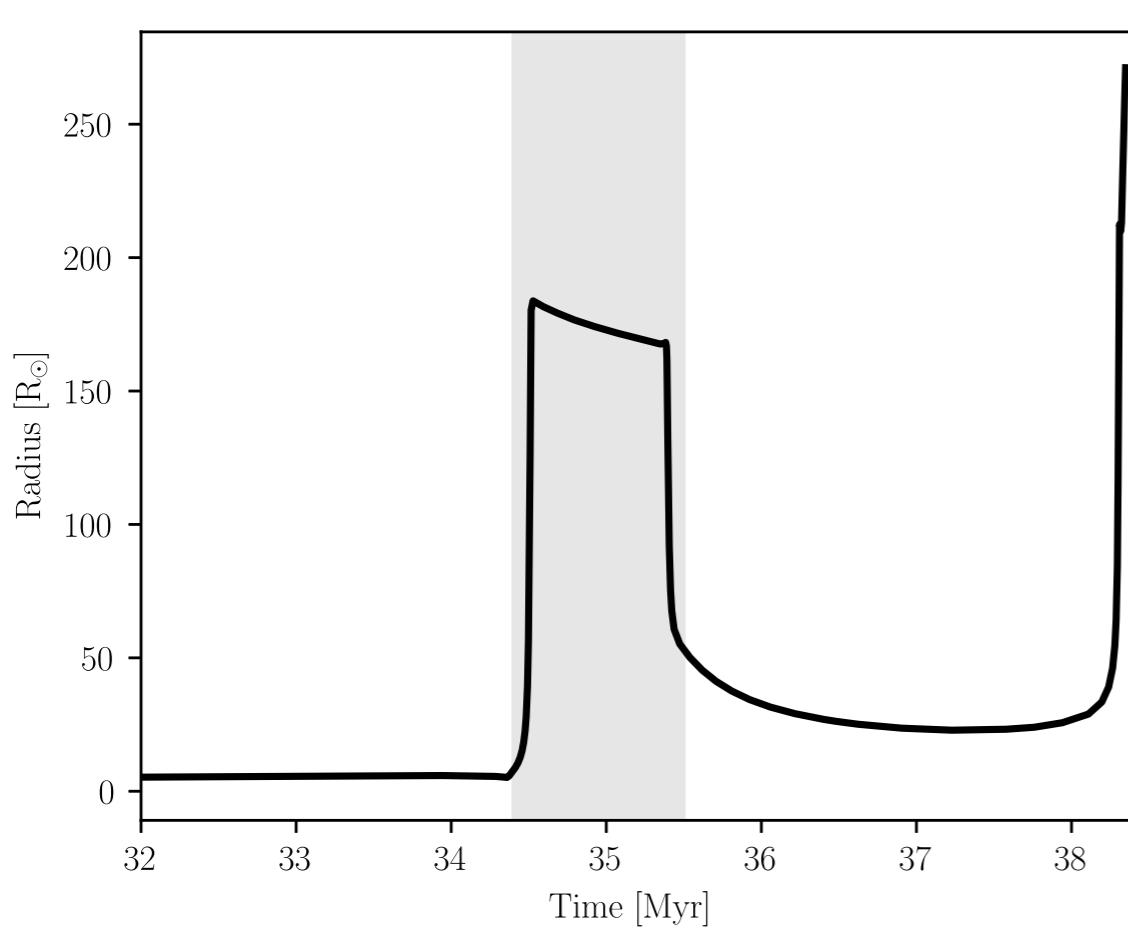

$$\varepsilon_\rho \rightarrow 0$$

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

$$R_a = \frac{2Gm}{v_\infty^2}$$

$$H_\rho = -\rho \frac{dr}{d\rho}$$

Range of Parameters to Explore

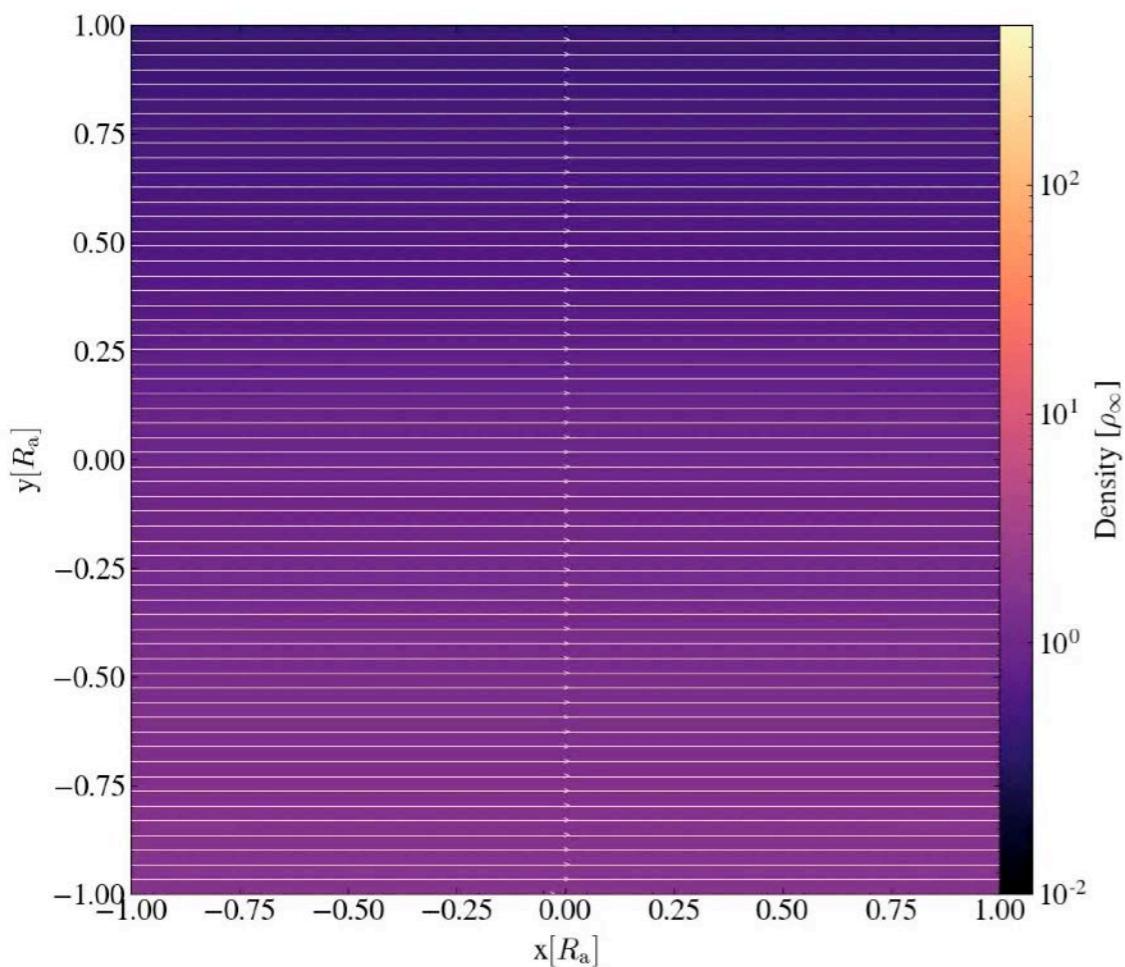

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

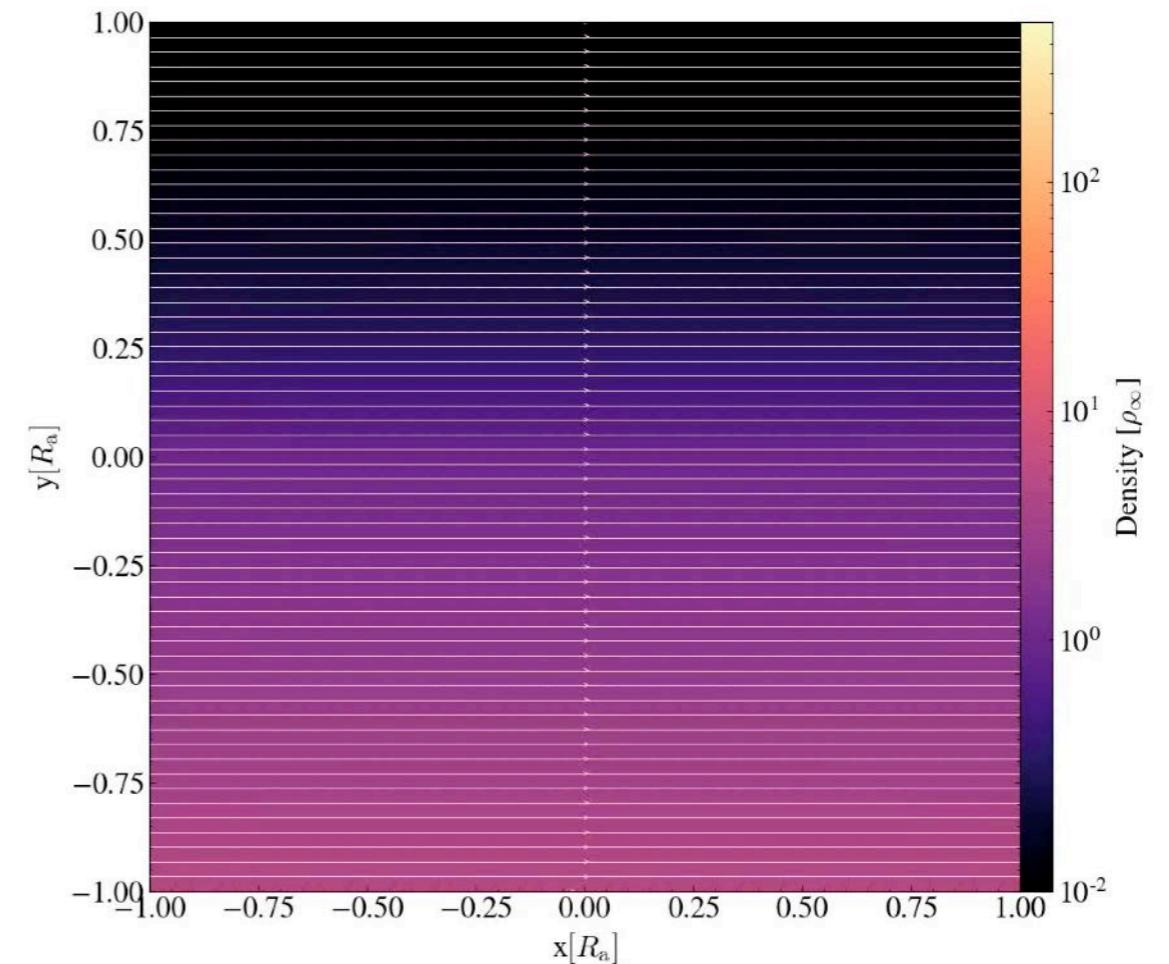

$$R_a = \frac{2Gm}{v_\infty^2}$$

$$H_\rho = -\rho \frac{dr}{d\rho}$$

Hydro Simulations

$$\varepsilon_\rho = 0.5$$

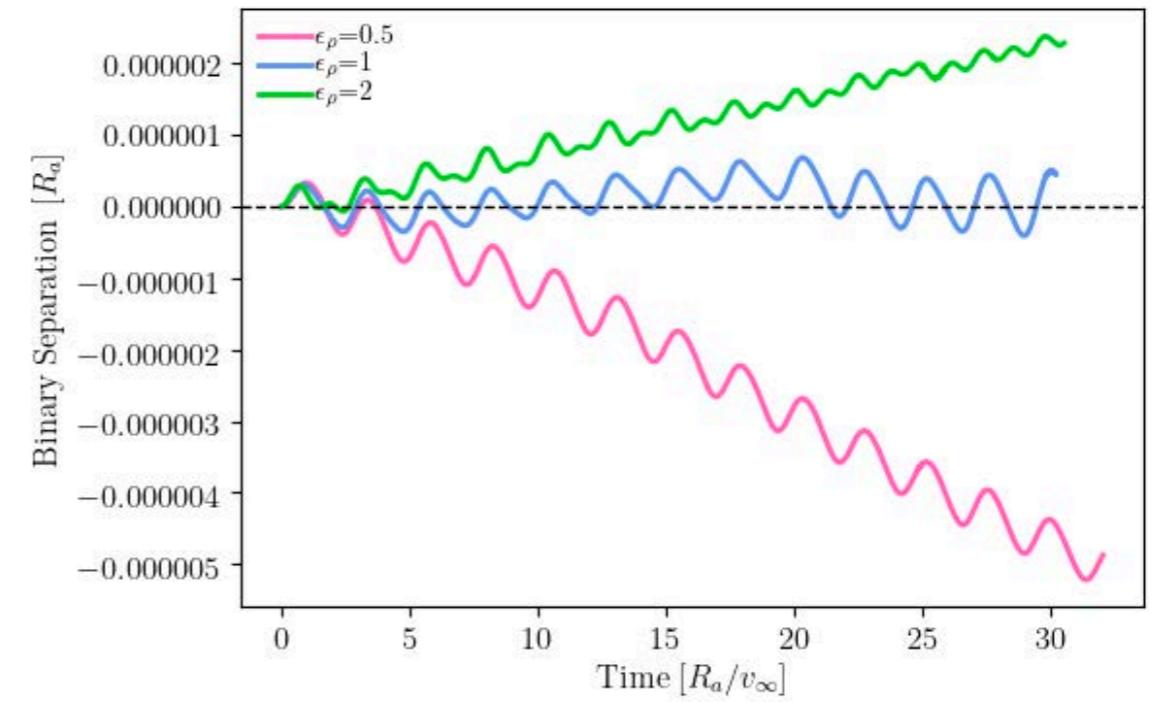

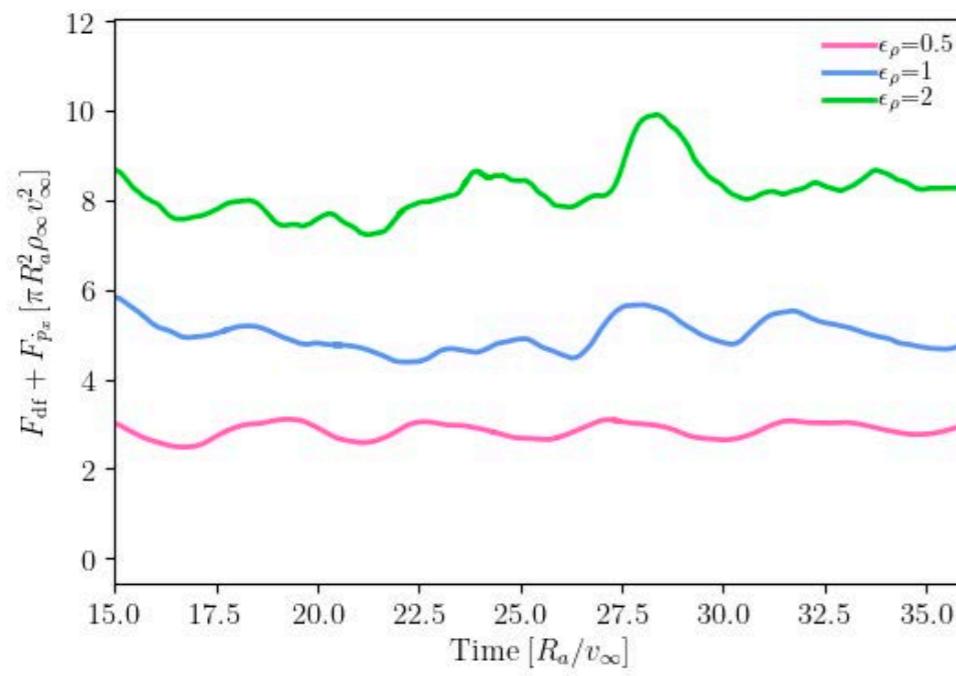

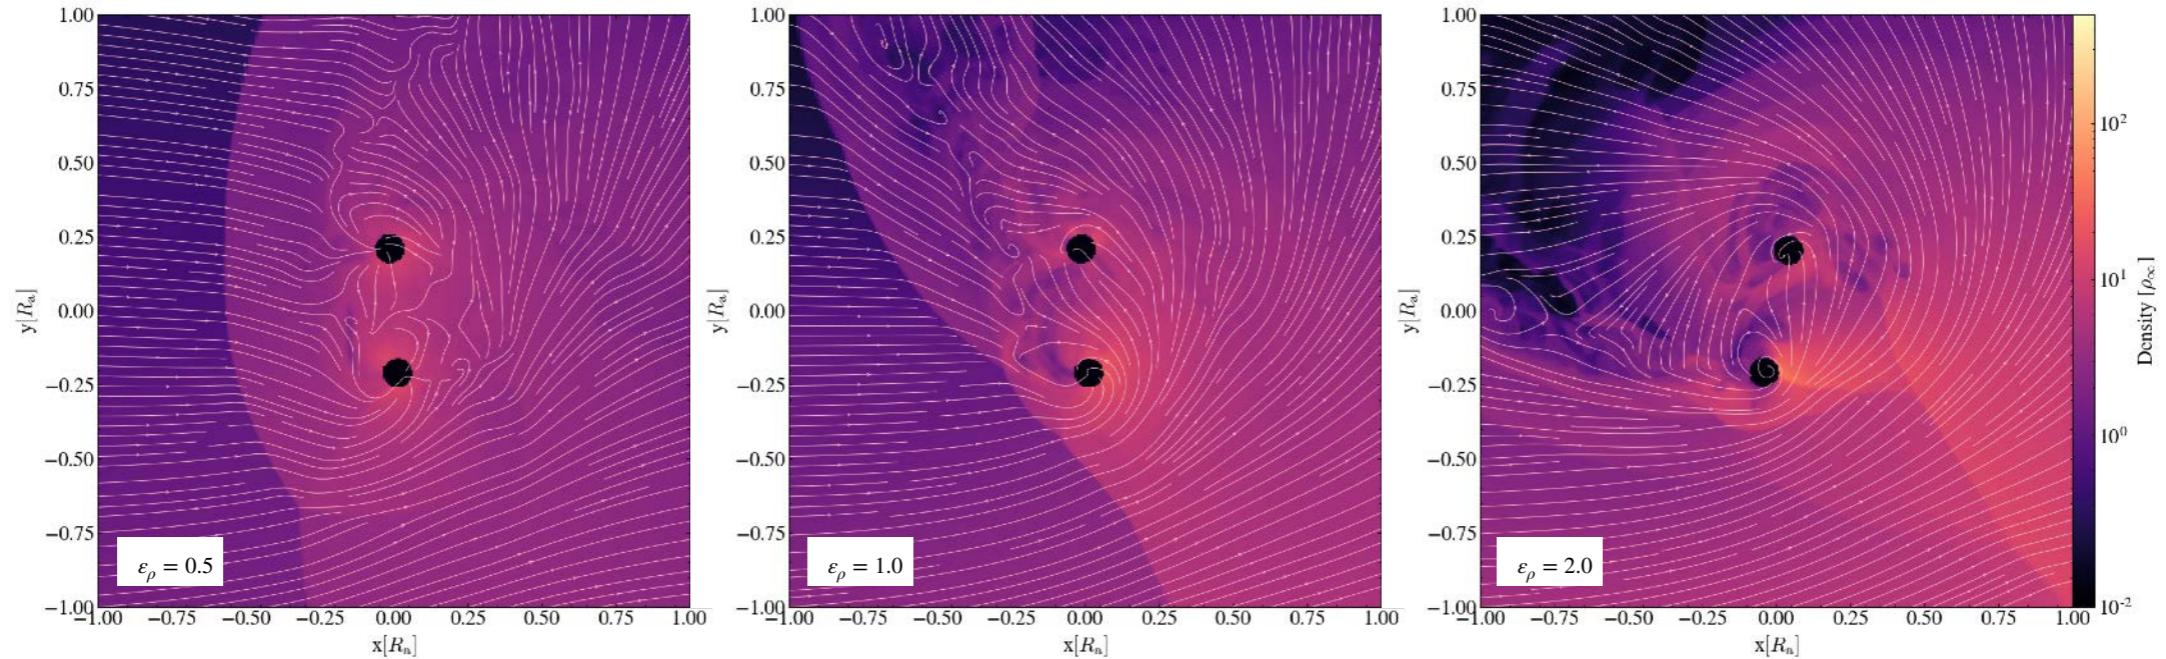

$$\varepsilon_\rho = 2.0$$

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

$$R_a = \frac{2Gm}{v_\infty^2}$$

$$H_\rho = -\rho \frac{dr}{d\rho}$$

Dependance with ε_ρ

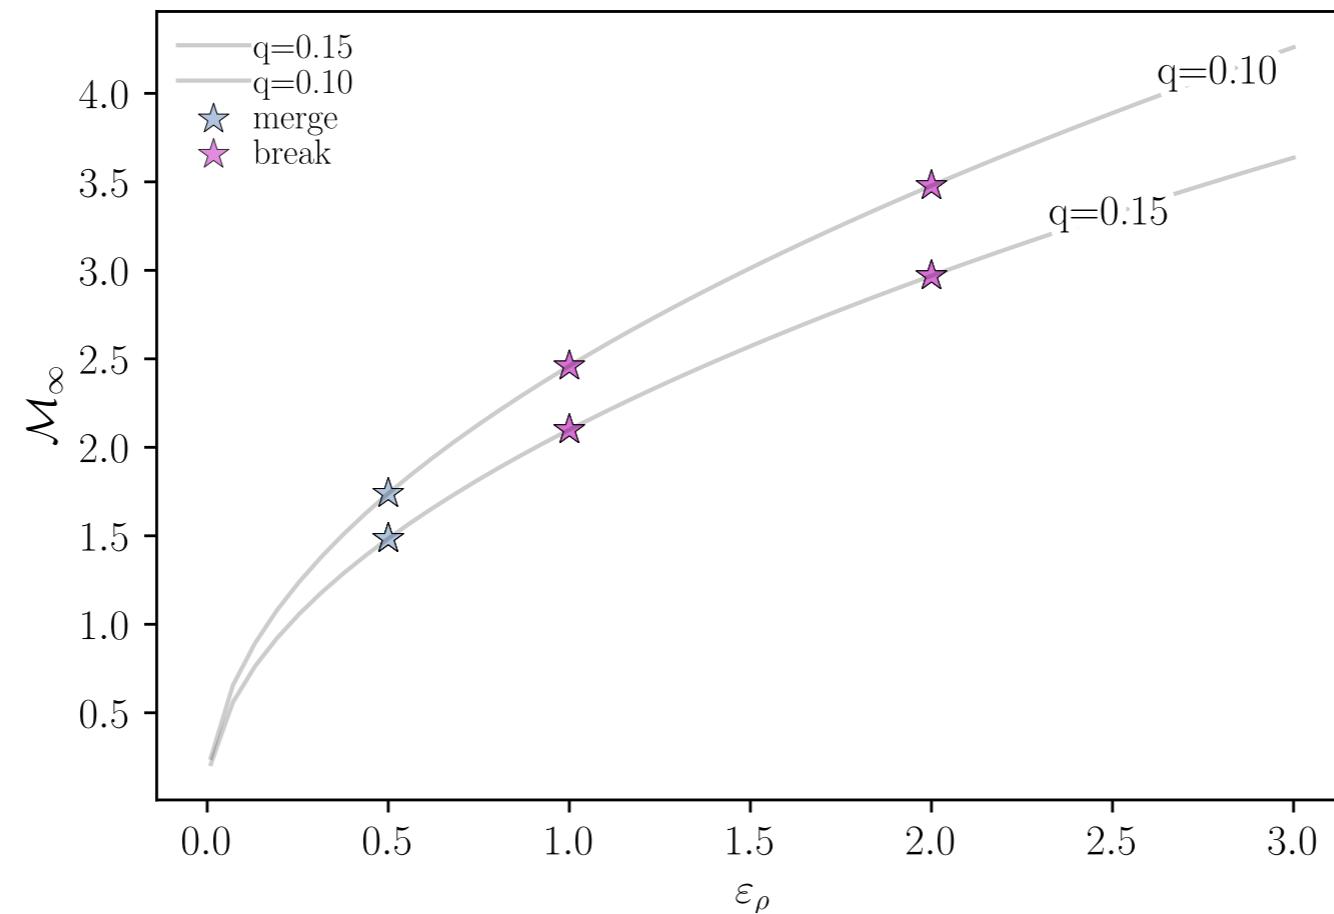

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

$$R_a = \frac{2Gm}{v_\infty^2}$$

$$H_\rho = -\rho \frac{dr}{d\rho}$$

Relationships between gas parameters

$$\mathcal{M}_\infty = \frac{v_\infty}{c_{s,\infty}}$$

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

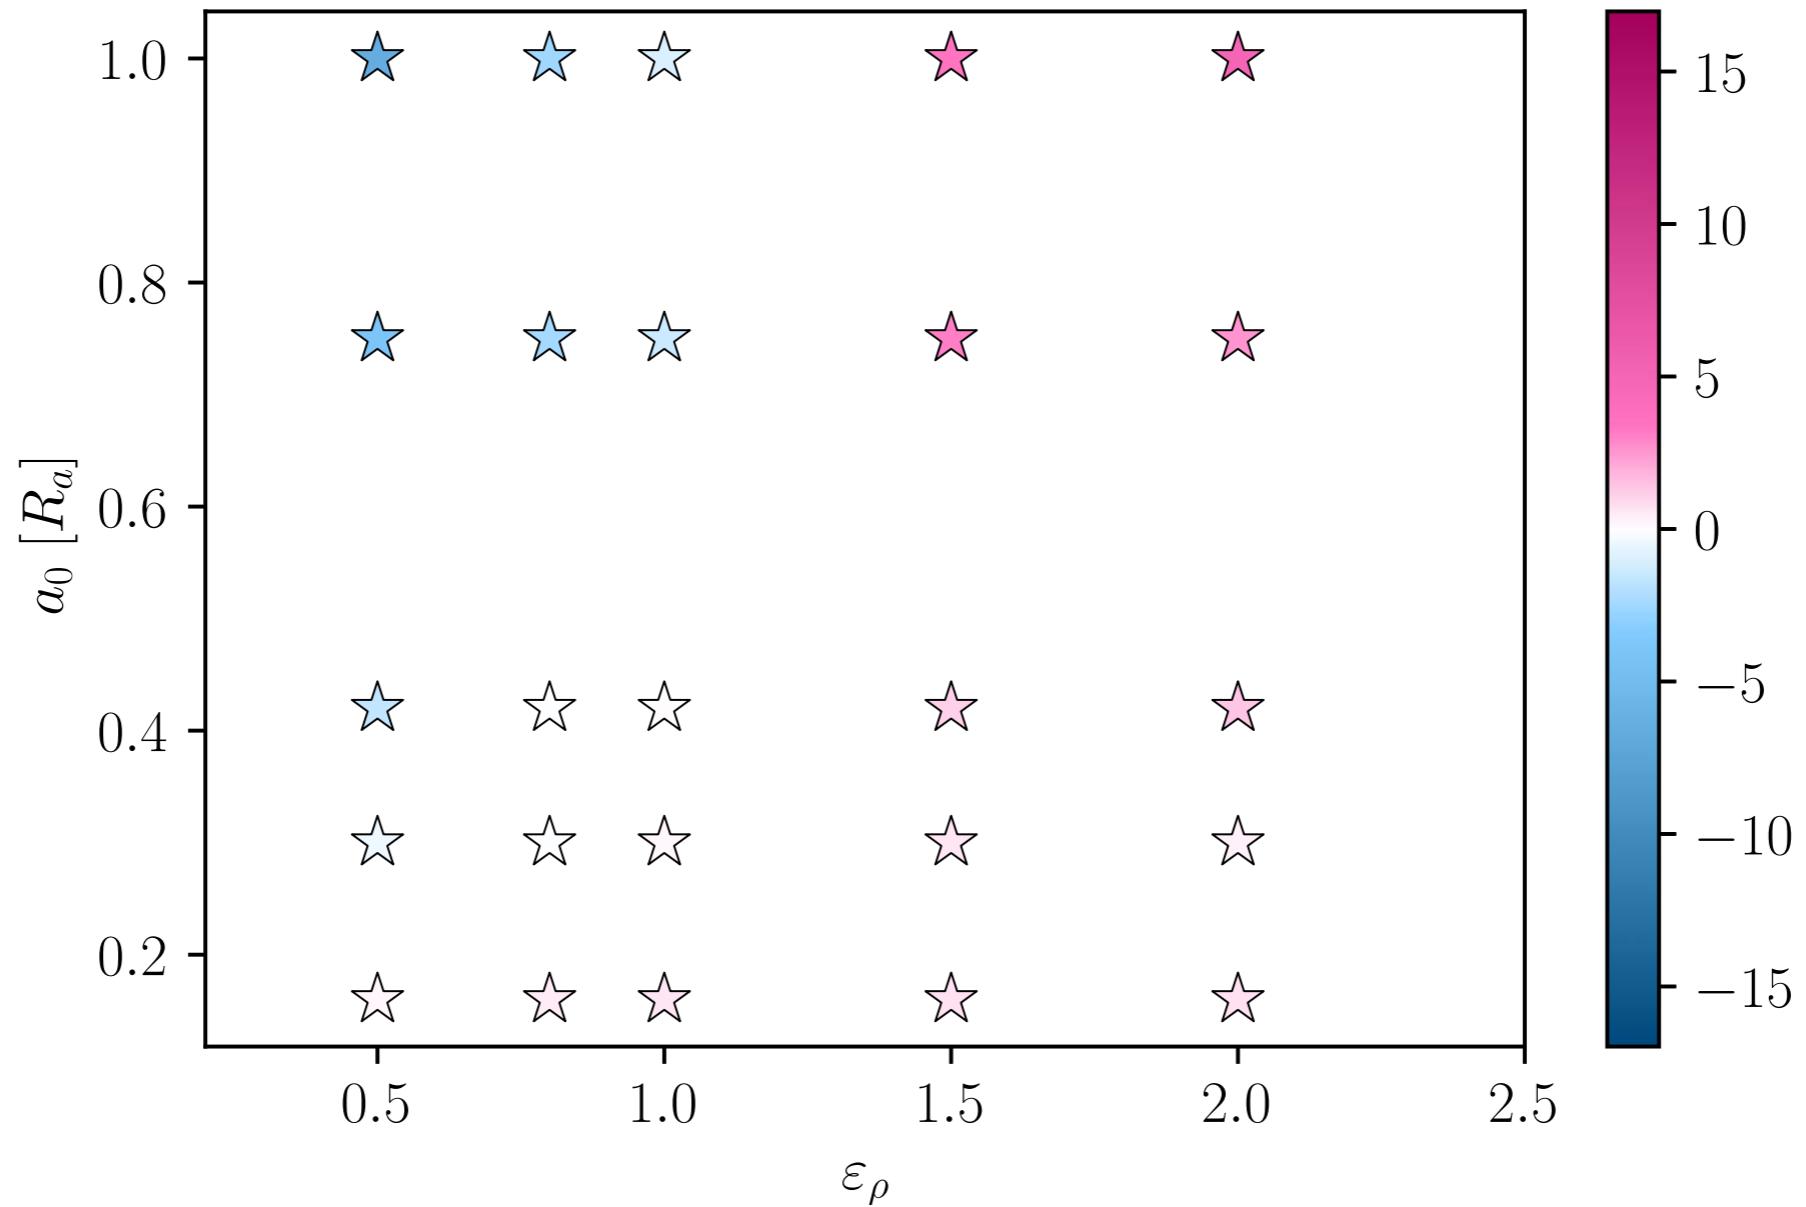

$$q = \frac{m}{M}$$

$$\varepsilon_\rho = \frac{R_a}{H_\rho}$$

$$R_a = \frac{2Gm}{v_\infty^2}$$

$$H_\rho = -\rho \frac{dr}{d\rho}$$

Dependance with a_0

Conclusions

- It is not always the case that the drag force due to the surrounding material will shrink a binary
- Depending on the initial conditions of the system, the tidal radius of the binary might change
- Under the common envelope conditions, we will most likely have a binary that expands and can never merge
