

Advancing CMB component separation: HEALPix Parameters' ... Maps

Gabrielle Stewart, Mentor: Elena de la Hoz

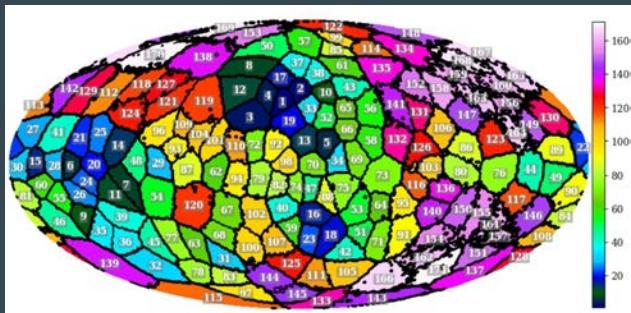

Background

- Use of primordial GW \rightarrow inflation; CMB polarization \rightarrow tracer for inflation

Problem: other phenomena emit in this frequency range of microwaves

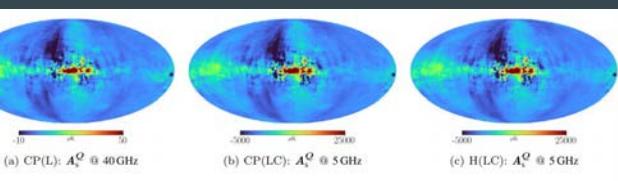

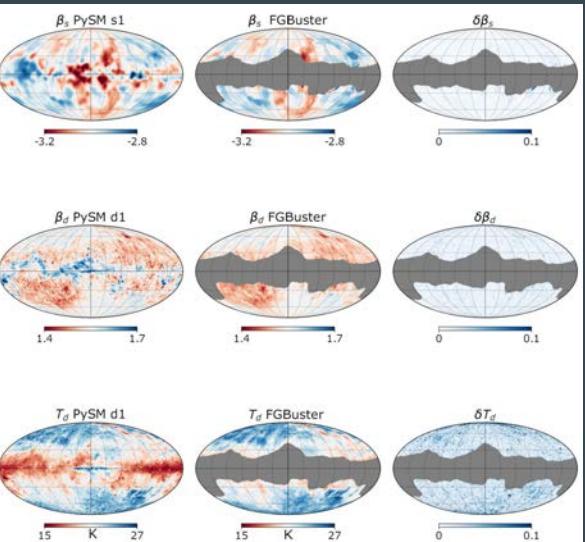

- We need to solve component problem to recover CMB signal data
 - Parametric component separation method
 - However, parameter space could be large, so overall uncertainty to recover CMB is large.

Pipeline: clustering pipeline to reduce dimensionality parameter space

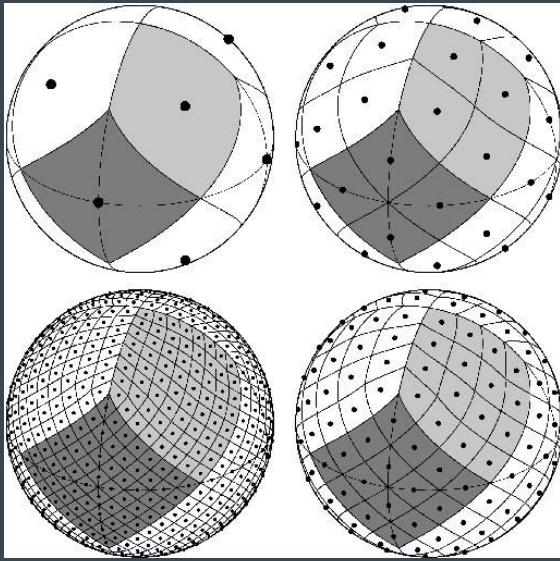

Mean-Shift Clustering Al. - Grumitt et al,
<https://arxiv.org/pdf/1910.14170>

Foreground Parameters - Puglisi et al,
<https://arxiv.org/pdf/2109.11562>

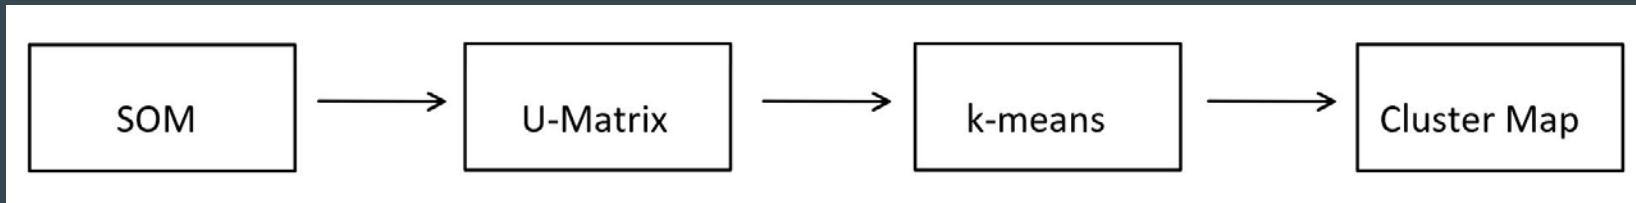

Synchrotron and Dust Amplitude Map Example -
Grumitt et al, <https://arxiv.org/pdf/1910.14170>

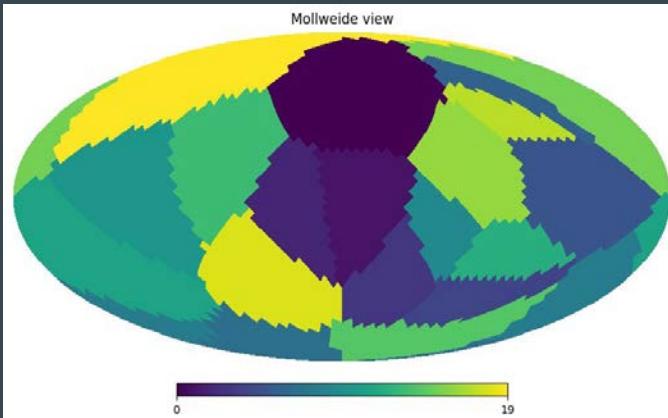

HEALPix - Gorski et al,
<https://arxiv.org/abs/astro-ph/9905275>

Methods

- 1) To train SOM and test method -> simulations using Voronoi tessellation
- 2) U-matrix based on hyperparameters
- 3) K-means is an unsupervised ML algorithm, splits data into clusters
- 4) Cluster Map:

Currently: find the BMU for comparison map from pipeline
